

CODEALPHA INTERNSHIP REPORT: TASK 2 - PHISHING AWARENESS

1. TRAINING MODULE OVERVIEW

Internship Domain : Cyber Security

Task Assignment : Task 2 - Phishing Awareness Training

Delivery Format : Interactive Security Module & Assessment Framework

Target Audience : End-Users and Corporate Staff

2. CORE EDUCATIONAL OBJECTIVES

● Social Engineering Tactics:

- Urgency & Fear: Forcing swift action via panic vectors (e.g., account lockouts).
- Authority: Exploiting systemic administrative postures to mimic trust.

● Phishing Identification Rules:

- Domain Inspection: Isolating root markers right of sub-domain strings.
- Link Masking: Exposing destination differences hiding under URL shorteners.

3. RECONGNITION QUICK REFERENCE MATRIX

Indicator Type	Safe Pattern	Malicious Flag
----------------	--------------	----------------

Root Domain Structure	https://www.paypal.com/login	paypal.com.security-chk.in
-----------------------	---	---

Transport Protocol	HTTPS (Enforced SSL/TLS)	Plain HTTP over public IP
--------------------	--------------------------	---------------------------

Hyperlink Destination	Clear matching raw path	Obfuscated tracking short-links
-----------------------	-------------------------	---------------------------------

```

CODEALPHA PHISHING AWARENESS QUIZ APP
=====
Analyze the security scenarios below carefully.

[CASE PROFILE 1]
Scenario 1: You receive an urgent notice from your company 'IT Helpdesk' claiming your password expires in 2 hours. It requests a verification click to 'http://login.yourcompany-portal-update.com'.
A) Update your credentials quickly to ensure no enterprise system access interruptions.
B) Flag the transmission. The URL string relies on an unverified look-alike domain destination.

Select your response (A/B): A

❌ THREAT DETECTION MISSED.
Correct! Legitimate enterprise networks use official infrastructure channels, not external look-alike domains.
=====

[CASE PROFILE 2]
Scenario 2: An email notification alerts you about a failed streaming subscription payment. Hovering over the recovery action button displays a hidden path pointing to 'http://bit.ly/3xv7z9p'.
A) Ignore the warning. Attackers routinely deploy URL shorteners to obscure fake authentication gates.
B) Access the shortcut. Short-links are standard optimizations for responsive screen handling.

Select your response (A/B): B

❌ THREAT DETECTION MISSED.
Correct! URL shorteners hide the real landing destination. Navigate to the official service manually instead.
